BELLOWS EXPANSION JOINTS

FALTENBALG DEHNUNGS - KOMPENSATOREN

Construction:

Annularly corrugated metal bellows formed from butt-welded tubes. Designed and manufactured fully in accordance with the respective "EJMA" standards and in conformity with the pressure and temperature ratings as per DIN 2401.

Materials:

Bellows and internal sleeves (liners) made of stainless steel according to DIN 17440 bright. End connections either stainless steel or carbon steel. Other materials on request.

Connections:

Flanges, male or female threaded ends, swivel unions, welding ends.

Nominal diameters:

DN 25 (1") - DN 3600 (144")

Pressure Ratings:

up to max. 64 bar operation pressure depending on nominal diameter and operation temperature.

Temperature ranges:

- 196°C up to + 800°C depending on the material.

Operation applications:

Compensation of thermal and mechanical movements in pipelines of all kinds. Please consult us for advise on applications, specifications and installation.

Konstruktion:

Ringförmig gewellte Metallbälge aus stumpfgeschweißten Rohren geformt. Auslegung und Fertigung entsprechend den "EJMA" Normen sowie in Übereinstimmung mit den Druck- und Temperatur- Angaben gemäss DIN 2401.

Materialien:

Faltenbälge sowie innere Schutzhülsen (Führungsbuchse) aus nichtrostendem Edelstahl gemäss DIN 17440 blank. Anschlüsse aus nichtrostendem Edelstahl oder unlegiertem Stahl. Andere Materialien auf Anfrage.

Anschlüsse:

Flansche, Innen- oder Aussengewinde, Überwurfmuttern, Schweissenden.

Nennweiten::

DN 25 (1") - DN 3600 (144")

Druckbereiche:

bis max. 64 bar Betriebsdruck abhängig von der Nennweite und der Betriebstemperatur.

Temperaturbereiche:

- 196°C bis + 800°C Material abhängig.

Anwendungsbereiche:

Ausgleich von thermischen und mechanischen Bewegungen aller Art.
Nutzen Sie unsere Beratung bezüglich Anwendung, Einsatz und Installation.

AXIAL EXPANSION JOINTS

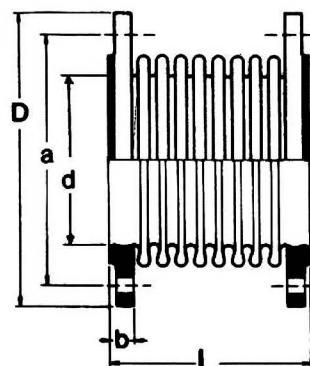

Single axial expansion joints featured in this leaflet are "Ex stock" units, which are available with floating or fixed flanges, male or female threaded ends as well as swivel unions and pipe welding ends according to DIN with short delivery times. Other standards (ANSI, BS, JIS) on request.

Pressure rating: PN 16

Designed and manufactured to compensate at least 1.000 full cycles at rated pressure and movements.

Masse in mm.

Please state in your order sheet:

"Ex stock" single axial expansion joints and: nominal diameter (DN), pressure rating (PN), materials, connections, medium and operation temperature as well as details of applications.

Lateral, universal, hinge, x-press, pressure balanced-types and rectangular expansion joints are available on request as well as designed and manufactured according to customers requirements.

AXIAL DEHNUNGS - KOMPENSATOREN

Die in diesem Datenblatt beschriebenen Einzelbalg Axial Dehnungs-Kompensatoren sind "Ab Lager" Geräte, welche mit Los- oder Festflansche, Innen- oder Aussengewinde sowie Überwurfmuttern oder Rohr- schweissenden gemäss DIN kurzfristig lieferbar sind. Andere Normen (ANSI, BS, JIS) auf Anfrage.

Druckbereich: PN 16

Ausgelegt und gefertigt zur Kompensation von mindestens 1.000 vollen Schwingungen im angegebenen Druck - und Momentenbereich.

Bei Bestellung bitte angeben:

"Ab Lager" Einzelbalg Axial Kompensatoren sowie: Nennweite (DN), Druckbereich (PN), Material, Anschlüsse, Medium und Betriebstemperatur sowie Angaben über den vorgesehenen Einsatz.

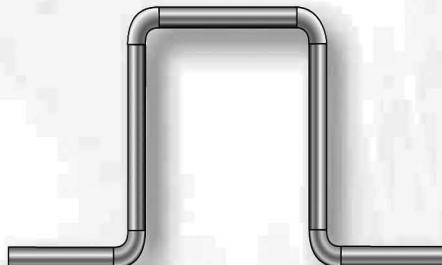

Laterale, universale, Anlenkung-, X-Druck-Druckentlastungs- und Rechteckig- Dehnungs-Kompensatoren auf Anfrage und entsprechend Kundenwünschen ausgelegt und gefertigt.

[EXPANSION JOINT DESIGN BASICS]

Piping Flexibility

All materials expand and contract with thermal change. In the case of piping systems, this dimensional change can produce excessive stresses throughout the piping system and at fixed points such as vessels and rotating equipment, as well as within the piping itself.

Pipe loops may add the required flexibility to a piping system if space permits, however the initial cost of the additional pipe, elbows and supports must be considered. In addition, increased continuous operating costs due to pressure drop may result from the frictional resistance of the flowing media through additional elbows and pipe. In some cases, pipe diameter must be increased to compensate for losses due to pressure drop.

A practical and cost effective means of achieving piping system flexibility in a compact design is through the application of expansion joints. The most efficient piping system is the shortest and most directly routed system and expansion joints make this possible.

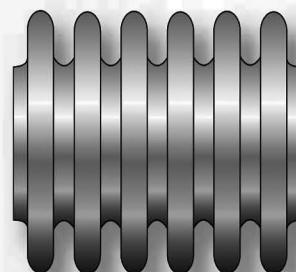

Expansion joints provide an excellent solution for isolation of settlement, seismic deflection, mechanical vibration and sound attenuation transmission produced by rotating equipment.

Design Basics

Metal bellows expansion joints consist of a flexible bellows element, appropriate end fittings such as flanges or butt-weld ends to allow connection to the adjacent piping or equipment, and other accessory items that may be required for a particular service application.

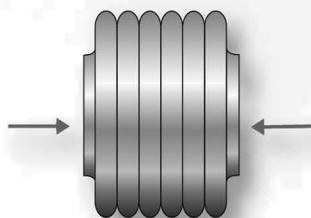

B E L L O W S D E S I G N

Bellows are manufactured from relatively thin-walled tubing to form a corrugated cylinder. The corrugations, commonly referred to as convolutions, add the structural reinforcement necessary for the thin-wall material to contain system pressure. The bellows designer selects the thickness and convolution geometry to produce a bellows design that approaches, and often exceeds the capacity of the adjoining pipe to contain system pressure at the specified design temperature.

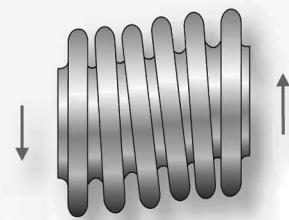

Flexibility of the bellows is achieved through bending of the convolution sidewalls, as well as flexing within their crest and root radii. In most cases, multiple convolutions are required to provide sufficient flexibility to accommodate the expected expansion and contraction of the piping system.

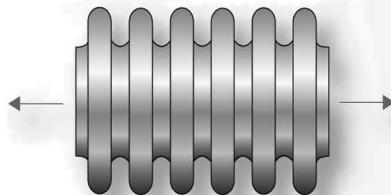

MOVEMENT CAPABILITIES

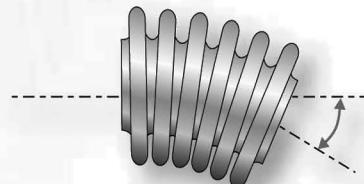

Axial Compression: Reduction of the bellows length due to piping expansion.

Lateral Offset: Transverse motion which is perpendicular to the plane of the pipe with the expansion joint ends remaining parallel.

Axial Extension: Increase of the bellows length due to pipe contraction.

Angular Rotation: Bending about the longitudinal centerline of the expansion joint.

Torsion: Twisting about the longitudinal axis of the expansion joint can reduce bellows life or cause expansion joint failure and should be avoided. Expansion joints should not be located at any point in a piping system that would impose torque to the expansion joint as a result of thermal change or settlement.

CYCLE LIFE

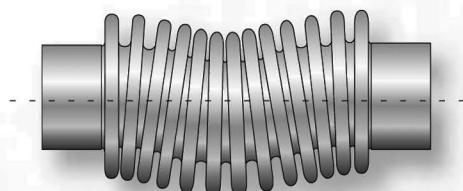

In most applications, design movements cause the individual convolutions to deflect beyond their elastic limits, producing fatigue due to plastic deformation, or yielding. One movement cycle occurs each time the expansion joint deflects from the installed length, to the operating temperature length, and then back again to the original installation length.

In the majority of applications, total shutdowns are infrequent, therefore a bellows with a predicted cycle life of one or two thousand cycles is usually sufficient to provide reliable fatigue life for decades of normal service. High cycle life designs may be desirable for service applications that include frequent start up/shut down cycles.

The bellows designer considers such design variables as material type, wall thickness, the number of convolutions and their geometry to produce a reliable design for the intended service with a suitable cycle life expectancy.

SQUIRM

An internally pressurized bellows behaves in a manner similar to that of a slender column under compressive load. At some critical end load, the column will buckle, and in a similar manner, at a sufficient pressure, an internally pressurized bellows that is installed between fixed points will also buckle, or squirm.

Bellows squirm is characterized by a gross lateral shift of the convolutions off of the longitudinal centerline. Bellows squirm can reduce cycle life, or in extreme cases, produce a catastrophic failure.

To avoid squirm, the bellows designer must limit movement capacity and flexibility to a level that insures that the bellows retains a conservative margin of column stability beyond the required design pressure.

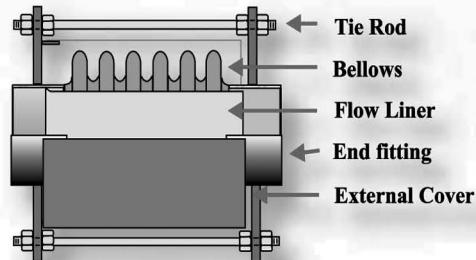

END FITTINGS

Expansion joints will include appropriate end fittings such as flanges or butt-weld ends that should match the dimensional requirements and materials of the adjoining pipe, or equipment. Small diameter compensators are available with threaded male ends, butt weld ends or copper sweat ends. Threaded flanges may be added to the threaded end compensators if a flanged connection is preferred.

ACC E SSORIES

Flow liners are installed in the inlet bore of the expansion joint to protect the bellows from erosion damage due to an abrasive media or resonant vibration due to turbulent flow or velocities which exceed:

- For air, steam and other gases
 - a) Up to 6" dia.- 4 ft./sec./inch of diameter
 - b) Above 6" dia. -25 ft/sec
- For water and other liquids
 - a) Up to 6" dia. - 2 ft./sec./inch of diameter
 - b) Above 6" dia. -10 ft./sec.

Expansion joints that are installed within ten pipe diameters downstream of elbows, tees, valves or cyclonic devices should be considered to be subject to flow turbulence. The actual flow velocity should be multiplied by 4 to determine if a liner is required per the above guidelines. Actual or factored flow velocities should always be included with design data, particularly flow that exceeds 100 ft./sec. which require heavy gauge liners.

External Covers are mounted at one end of the expansion joint, providing a protective shield that spans the length of the bellows. Covers prevent direct contact with the bellows, offering personnel protection, as well as protection to the bellows from physical damage such as falling objects, weld splatter or arc strikes. Covers also provide a suitable base for external insulation to be added over an expansion joint. Some insulating materials, if wet, can leach chlorides or other substances that could damage a bellows.

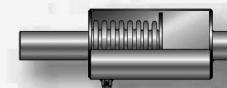

Tie rods eliminate pressure thrust and the need for main anchors required in an unrestrained piping system. Axial movement is prevented with the use of tie rods. Designs that have only two tie rods have the additional ability to accommodate angular rotation. Limit rods are similar, however they accommodate a specified axial capability.

SINGLE & DOUBLE EXTERNALLY PRESSURIZED EXPANSION JOINTS

Externally pressurized expansion joints are designed for use in straight pipe runs to accommodate high pressure and large amounts of thermal expansion and contraction. Pressure is applied to the bellows external surface via a gap between the inner guide ring and outer pipe shell. The stabilizing effect of external pressure permits use of a longer bellows with larger movement capability than a comparable internally pressurized design.

This rugged construction fully encases the bellows, assuring a high level of safety and durability. A convenient drain port is included that allows removal of condensate and sediment in steam service applications.
